Summary

Alan is a skilled programmer with 18 years of full time software development experience in the online entertainment industry, in startups, and in large international corporations. Alan has current experience with Go, GraphQL, React, AWS, Kubernetes, PostgreSQL and MySQL. He also enjoys exploring Clojure and ClojureScript.

Experience

- 10/2022–09/2025 **Senior Developer**, *Looka*, Toronto, Ontario
Laid off due to company-wide reduction in force.
- Led Go and GraphQL back-end development for, and successfully launched, two new features to Looka's flagship web application, [looka.com](#):
 - Google Workspace Reseller - allow customers to purchase and manage Google Workspace subscriptions through the Looka web application.
 - AWS website hosting - allow customers to host and manage branded websites designed within the Looka web application.
 - Implemented a drop-shadow feature for the web application's SVG-based graphic editor.
 - Created TypeScript scripts for the Customer Service team, resulting in faster customer ticket resolution times, in increased autonomy of the Customer Service team, and in less engineering involvement in resolving complex customer tickets.
- 09/2021–10/2022 **Senior Software Engineer**, *Betable*, Edmonton, Alberta
- Designed, implemented and delivered a React and Redux front end, and Rest endpoints on the back end, to manage third-party online casino games. This replaced a cumbersome manual process that could only be performed by engineers. The new system was user-friendly enough for all game management tasks to be handed over to a non-engineer.
 - Major contributor to a new Adyen Payment integration with existing online casinos and an existing accounting system. The backend of the integration was a Go microservice, and the frontends were Angular and React.
- 01/2016–09/2021 **Software Engineer**, *Betable*, Edmonton, Alberta
- Added backoffice web application functionality for the marketing team to easily create, edit, and schedule game offers, bonus packages, and promotions. The tool was developed using React and Redux.

- 08/2013–10/2015 **Developer**, *Gamesys Canada*, Edmonton, Alberta
Laid off due to company restructuring. Member of the Poker Integrity team for the Virgin Poker facebook app, formerly at <https://apps.facebook.com/virginpoker/>
○ Designed and implemented a single-page Backbone application to interface with microservices responsible for creating and scheduling online poker tournaments.
○ Contributed to the implementation of a single-page GWT application to visualize poker game session and win/loss data. This was used to investigate fraud.
- 10/2011–08/2013 **Developer**, *CGI Canada*, Edmonton, Alberta
Designed and delivered enhancements for two public sector JEE web applications.
- 03/2007–09/2011 **IT Specialist**, *IBM Canada*, Edmonton, Alberta
Designed and delivered over 30 enhancements and fixes for two public sector JEE web applications.
○ One of these applications is eHealth Saskatchewan's "Pharmaceutical Information Program", <https://www.ehealthsask.ca/pip>.
- 01/2007–03/2007 **Junior Developer**, *ShirWin Knowledge and Learning Inc.*, Edmonton, Alberta
Implemented a real-time chat system and completed user interface components for a systematic/critical review web application using Java, JavaScript and PHP.

Education

- 2005 **Masters of Science**, *University of Alberta*, Edmonton
Pure Mathematics
- 2002 **Bachelor of Science**, *University of Alberta*, Edmonton
Mathematics Specialization

Technical Skills

- Programming languages Go, Clojure, ClojureScript, TypsScript, Java
- Framworks and libraries React, Redux, Re-frame, GraphQL
- Integrations Stripe, AWS, Google Workspace
- Software and tools Kubernetes, Docker, MySQL, PostgreSQL, CassandraDB, MongoDB, Git

Personal Projects

- RealWorld Clojure <https://github.com/akydd/realworld-clojure>. A Clojure implementation of the RealWorld API, <https://realworld-docs.netlify.app/>.
- 2-player Pong https://github.com/akydd/multi_pong_server & https://github.com/akydd/multi_pong. 2-player client-server Pong game with basic client-side prediction. Node.js and Phaser.io with websockets.
- MOS Technology 6502 Emulator https://github.com/akydd/nes_emulator. Originally planned as an NES emulator, it fully implemente the 8-bit 6502 instruction set, but does not emulate the clock speed. Written in C.
